Solar PV Engineer (Business Development & Project Execution)

Requirements

Education

- Bachelor/Honors
- Diploma
- Bachelor’s degree in electrical, Electrical & Electronic (EEE), Mechanical, or a related Engineering discipline with minimum 2 Years experiences.
- Diploma in electrical, electronics, power or related discipline with minimum 3 Years experiences.

Experience

2 to 3 years

- The applicants should have experience in the following business area(s): Engineering Firms, Power, Solar Energy

Additional Requirements

- 2–3 years of relevant experience in solar PV (rooftop and/or ground-mounted), renewable energy, or power sector project work — candidates with strong potential and less experience may also be considered
- Working knowledge of solar PV system design fundamentals (system sizing, inverter selection, net metering, structural considerations)
- Demonstrated ability to communicate confidently and professionally with clients, including non-technical stakeholders
- Willingness and ability to travel frequently for site visits across Bangladesh
- Proficiency in MS Office (Word, Excel, PowerPoint); familiarity with AutoCAD, PVsyst, or similar design tools is a plus
- Strong written and verbal communication skills in both Bangla and English

Preferred / Added Advantage

- Prior exposure to BESS (Battery Energy Storage Systems) integration
- Familiarity with World Bank/ADB procurement procedures or government tender (e-GP) processes
- Experience preparing techno-commercial proposals or pre-feasibility studies
- Existing professional network within Bangladesh`s industrial, RMG, or institutional sectors

- A valid driving license

Responsibilities & Context

About Hexagon BdTech Limited

Hexagon BdTech Limited (HBL) is a Dhaka-based engineering and EPC firm active in Bangladesh`s power, energy, and infrastructure sectors. We work across solar PV, battery energy storage systems (BESS), transmission and distribution, and EPC contracting — operating as both a prime contractor and a local subcontractor/agent on World Bank, ADB, and government-funded projects. HBL partners with leading global suppliers and a range of International Companies to deliver reliable, technically sound energy solutions across Bangladesh.

About the Role

HBL is looking for a multi-disciplinary Solar PV Engineer who can move comfortably between the technical and commercial sides of the business. This is not a narrowly defined role — you will be expected to develop solar PV business opportunities, engage directly with clients, assess and visit project sites, support proposal and tender preparation, and follow projects through to execution and handover. The ideal candidate is someone who enjoys variety, can manage their own time across competing priorities, and is equally comfortable in a client meeting, on a rooftop conducting a site assessment, or working through technical specifications and BOQs at a desk.

Location: Dhaka, Bangladesh (with frequent travel to project/site locations nationwide)

Department: Solar PV / Renewable Energy

Key Responsibilities

Business Development & Client Engagement

- Identify and pursue new solar PV business opportunities across industrial, commercial, and institutional clients
- Build and maintain relationships with existing and prospective clients, acting as a primary technical and commercial point of contact
- Support preparation of techno-commercial proposals, offers, and presentations for prospective clients
- Represent HBL in client meetings, site discussions, and where required, industry events or seminars

Site Assessment & Technical Evaluation

- Conduct site visits to assess roof/ground conditions, shading, structural suitability, electrical infrastructure, and load profiles for proposed solar PV (and BESS, where applicable) installations
- Prepare site assessment reports, technical feasibility notes, and preliminary system sizing/design inputs
- Coordinate with clients` technical teams to gather necessary data (electricity bills, load schedules, site drawings, etc.)

Proposal & Pre-Feasibility Development

- Develop pre-feasibility studies, CAPEX/OPEX scenarios, and financial models for proposed solar PV and BESS systems
- Prepare technical specifications, single-line diagrams (in coordination with design teams), and bill of quantities (BOQ) for client offers
- Support preparation of tender/bid documents for government and donor-funded (World Bank, ADB, etc.) solar and energy projects, where relevant

Project Development & Execution

- Support project planning, scheduling, and coordination during execution, working alongside EPC, procurement, and site teams
- Liaise with manufacturers, vendors, and subcontractors to ensure technical compliance and timely delivery
- Monitor project progress on-site, troubleshoot technical or coordination issues, and report status to management
- Assist in preparing project documentation, including commissioning reports, O&M materials, and client handover documents

Cross-Functional Coordination

- Work closely with HBL`s engineering, procurement, and proposal teams to ensure consistency between commercial offers and technical execution capability

- Contribute to internal knowledge-building on solar PV and BESS technologies, regulatory developments, and market trends in Bangladesh

Compensation & Other Benefits

- **What We Offer**

  Opportunity to work across the full lifecycle of solar PV and energy projects - from business development through execution
- Exposure to large-scale, donor-funded, and private-sector renewable energy projects
- A collaborative environment with experienced engineering and business development professionals
- Competitive salary commensurate with experience, plus performance-based incentives
- Professional growth opportunities within a growing renewable energy and EPC firm
