Computer network architect

National average salary: $129,566 per year

Primary duties: Computer network architects design and implement both local internal networks and cloud computing infrastructure for companies, while also researching and evaluating new networking tools for future use and considering information security in their designs, as a strong infrastructure is essential for any network to function properly. Additionally, computer network architects work collaboratively with other IT specialists and may oversee the installation and maintenance of networking systems. Their work is crucial in ensuring that organizations have efficient and secure networks that meet their business needs.
