Principal Software Engineer

ZoomInfo is where careers accelerate. We move fast, think boldly, and empower you to do the best work of your life. You'll be surrounded by teammates who care deeply, challenge each other, and celebrate wins. With tools that amplify your impact and a culture that backs your ambition, you won't just contribute. You'll make things happen–fast.

Mesh is ZoomInfo's internal AI platform. Thousands of employees use it every day — to run AI agents, build automated workflows, create microapps, and connect to the tools they already work in. It's a platform with a lot of moving parts, and a small engineering team that owns all of them.

We're looking for a Principal Software Engineer who raises the bar on how we ship, not just what we ship.

What you'll be doing:

Owning features across the full stack — React frontends, backend APIs, cloud infrastructure — from design through production
Responding to production incidents and shipping fixes
Building and improving core platform capabilities: AI agents, orchestration workflows, microapp infrastructure, LLM integrations
Developing SDKs and tooling for engineers who build on top of Mesh
Championing quality and reliability — tests, coverage, habits that prevent regressions
Collaborating across teams and supporting users directly through our Slack support channels
Mentoring engineers through code reviews and technical guidance
Why Mesh:

Small team, real impact — your contributions are visible and your opinions carry weight
We use AI tools heavily in our own workflow — Claude Code, AI-assisted code review, LLM-powered automation
Distributed systems, LLM reliability, workflow orchestration, real-time integrations — the problems are hard and varied
We move fast and we're getting smarter about how we do it
What you'll bring:

12+ years of software engineering experience with a track record of delivering reliable, scalable systems
Strong full-stack skills — React/TypeScript, backend services, cloud infrastructure
Experience building in a cloud-native environment, preferably GCP — Kubernetes, Cloud Functions, Pub/Sub, managed databases
Solid understanding of SQL and NoSQL databases — Postgres, MongoDB, Redis
Experience owning production systems — logs, incident triage, fixes under pressure
A real commitment to software quality — testing strategy, code review, regression prevention

Security awareness built into how you work
You disagree and commit — push back when something is wrong, but don't relitigate once a decision is made
Clear communication and experience in fast-moving, high-ownership environments
Preferred:

Experience with LLMs — Claude, GPT, Llama — and building applications on top of them

Familiarity with context engineering and RAG patterns

Experience with MCP or AI tool integrations

Experience with Temporal or similar workflow orchestration systems

Experience with vector databases — Pinecone, pgvector, etc.

Experience building developer-facing SDKs or platform tooling

Experience with CI/CD pipelines, particularly GitHub Actions
