[Hiring] Senior Full Stack Engineer (Backend-Heavy) — Supply Chain Platform | Rappi Turbo | Mumbai Hybrid | Python/Golang/NodeJS | 4–7 yrs exp

We're hiring a Senior Full Stack Engineer to build and scale the Supply Chain Planning Platform for Rappi Turbo — Latin America's ultra-fast delivery network (10-minute delivery across LATAM).

This is a genuinely interesting engineering problem — not typical CRUD work. You'll be building systems that power purchase order optimisation, inventory replenishment decisions, and transfer order planning across a network of dark stores, processing massive real-time and batch datasets.

What you'll work on:

Purchase Order and Transfer Order creation + optimisation engines

Inventory allocation and replenishment decision systems

High-throughput data pipelines (real-time + batch) supporting LATAM operations

APIs and microservices for enterprise-scale planning workflows

Tech Stack: Python • Django • Golang • NodeJS • Kotlin/Java • PostgreSQL • MongoDB • Redis • Docker • AWS/GCP

What we're looking for:

4–7 years backend/full-stack experience in data-intensive platforms

Strong system design and scalability fundamentals

Experience in supply chain, logistics, marketplace, or quick commerce is a plus

Based in Mumbai — hybrid role (not remote)
