Requirements

Experience: Senior
English: Professional

Position

We’re hiring a Senior Software / Platform Engineer to build secure, reliable “paved roads” for both AI Engineers & agentic AI systems (LLM apps, agents, and MCP-based integrations). You’ll design and ship guardrails that make the safe path the easiest path - so teams can move fast without increasing blast radius. We’re targeting solid generalist software / SRE engineers. This is a hands-on builder role with a heavy focus on Security & Reliability, suitable for:

- Backend / Full-stack Software Engineers with DevEx experience building internal tooling
- AI security software engineers
- Site Reliability Engineers
- Platform Engineers
- DevSecOps Engineers (who shipped code!)

Responsibilities

- Design and build platform capabilities that enable safe, scalable adoption of AI systems across the organization.
- Develop secure-by-default platform components (APIs, services, and guardrails) that abstract security complexity and allow engineering teams to move quickly.

- Establish evaluation and safety gates in delivery workflows, including regression checks, model provenance validation, safety testing, and reliability improvements over time.
- Identify weaknesses in architectures and implement improvements that strengthen prevention, detection, and response capabilities across the AI stack.
- Partner with GenAI engineers and cross-functional teams to unify security guardrails, telemetry, and developer experience into coherent “golden paths.”
- Integrate with enterprise identity systems (SSO, SCIM) and design authorization frameworks combining ABAC and ReBAC for agentic and service-to-service access.

Requirements

- 5+ years of software/platform engineering experience shipping internal tooling, developer portal, or developer productivity systems.
- Strong software engineering & System Design experience, with architecture instincts beyond just coding.
- Familiarity with reliability patterns (e.g., observability, rollbacks, GitOps, incident management) and secure-by-design thinking.
- Strong sense of initiative and interest in AI is essential; you’ll be delivering & championing secure AI adoption across a global leader in Mobile Gaming, supporting titles like Pokémon Go!, Monopoly Go!, and Marvel StrikeForce.
- Strong candidates are encouraged to apply even if you don’t meet all the requirements.

Nice to Have

- Experienced with Data Intensive Applications & middleware/message brokers.
- Experience with AI agent runtimes/tool calling LLMs / MCP-style connectors, sandboxing, or isolation patterns.

- Experience with policy-as-code (OPA/Gatekeeper/Kyverno) and developer platform patterns.
- Familiarity with AI security, OWASP, threat modeling, Secure Software Development Lifecycle (S-SDLC), and adversarial simulations for artificial intelligence systems.
- Experience with distributed system design, microservices, scalability, caching, messaging, or MLOps & Data Engineering.
