Software Engineer, Clinical Data (TypeScript, FHIR/HL7)

1. Overview

A leading digital health technology company is hiring a Software Engineer, Clinical Data to design and build the backend integration services that move clinical data between electronic health record (EHR) systems. You'll architect integrations using HL7 v2, FHIR, and EHR APIs in TypeScript/Node.js.

This is a full-time, on-site W-2 employment position with Cincinnatus LLC, based in Seattle, WA or Madison, WI, with the opportunity to be placed at a leading healthcare technology company as part of their extended workforce.

2. Key Responsibilities

- Build robust TypeScript/Node.js services for EHR integrations.
- Architect integration services using HL7 v2, FHIR, and EHR APIs.
- Deploy microservices on AWS with containerization; implement data validation, monitoring, and HIPAA-compliant security.
- Contribute to code reviews and system-design discussions.
- Use AI-assisted coding tools to accelerate development, and collaborate with product managers on clinical workflow solutions.

3. Core Qualifications

- 3+ years building production systems with Node.js and TypeScript.
- Prior experience at a healthcare startup or health-data integration platform, with knowledge of FHIR, HL7, patient identity management, or clinical data modeling.
- Strong computer science fundamentals: algorithms, data structures, OOP, concurrency, and distributed systems.
- RESTful or event-driven API design and implementation experience.
- Microservices or cloud-native application scaling experience (AWS, Kubernetes).
- Must be a U.S. citizen or permanent resident located in the United States; this role is on-site in Seattle, WA or Madison, WI.

Preferred Qualifications

- Experience implementing OAuth2.0 / SMART on FHIR authentication flows.
